

METODE INTELIGENTE DE REZOLVARE A PROBLEMELOR REALE

Laura Dioşan
Vision Transformers

Istoric al modelelor de CV

Procesarea unei secvențe

Recurrent Neural Network

Works on **Ordered Sequences**
(+) Good at long sequences: After one RNN layer, h_T "sees" the whole sequence
(-) Not parallelizable: need to compute hidden states sequentially

1D Convolution

Works on **Multidimensional Grids**
(-) Bad at long sequences: Need to stack many conv layers for outputs to "see" the whole sequence
(+) Highly parallel: Each output can be computed in parallel

Self-Attention

Works on **Sets of Vectors**
(-) Good at long sequences: after one self-attention layer, each output "sees" all inputs!
(+) Highly parallel: Each output can be computed in parallel
(-) Very memory intensive

Transformer*

- ❑ Blocurile unui transformer au
 - Input – vectori (multimi de vectori)
 - Output – vectori (multimi de vectori)
 - Hyper-parametrii:
 - ❑ # bloks
 - ❑ # heads / block
 - ❑ width
- ❑ Vectorii comunica intre ei prin mecanismul de *self-attention* al
 - Unui singur head de procesare
 - A mai multor head-uri de procesare

Mecanismul de “atenție” (attention)

- Remember – embeddings
 - Imagini / patch-uri izolate precum:
 - Presupunem 2 attribute:

- caracterul tehnologic*
- nivelul de delicatete*

- Attention**

- Contextul e ca un magnet!
- Atrage elementele care se potrivesc!

Mecanismul de “atenție” (attention)

□ Similaritatea între patch-uri

Cuvântul	<i>caracterul tehnologic</i>	<i>nivelul de delicatețe</i>
	3	0
	4	1
	0	4

□ $\text{sim} \left(\begin{array}{c} \text{[patch 2]} \\ \text{[patch 1]} \end{array} \right) = 12$
 $\text{sim}([4,1], [3,0]) =$
 $4*3 + 1*0 = 12$

□ $\text{sim} \left(\begin{array}{c} \text{[patch 2]} \\ \text{[patch 3]} \end{array} \right) = 4$
 $\text{sim}([4,1], [0,4]) =$
 $4*0 + 1*4 = 4$

□ $\text{sim} \left(\begin{array}{c} \text{[patch 1]} \\ \text{[patch 3]} \end{array} \right) = 0$
 $\text{sim}([3,0], [0,4]) =$
 $3*0 + 0*4 = 0$

Mecanismul de “atenție” (attention)

Contextul patch-urilor – matricea de afinitate

$$\square \text{ sim}(\text{bird patch}, \text{bird patch}) = 1 / \sqrt{2} = 0.7$$

$$\begin{aligned} \square \text{ sim}(\text{bird patch}, \text{plant patch}) &= \\ \text{sim}([2, 2], [0, 4]) &= \\ (2*0 + 2*4) / \sqrt{2} &= \\ 8 / \sqrt{2} &= 5.65 \end{aligned}$$

Mecanismul de “atenție” (attention)

Contextul patch-urilor – matricea de afinitate

					
		0.70		5.65	
		5.65		0.70	

$$\square \text{sim}(\text{parrot patch}, \text{parrot patch}) = 1 / \sqrt{2} = 0.7$$

$$\begin{aligned} \square \text{sim}(\text{parrot patch}, \text{potted plant patch}) &= \\ \text{sim}([2,2], [0,4]) &= \\ (2*0 + 2*4) / \sqrt{2} &= \\ 8 / \sqrt{2} &= 5.65 \end{aligned}$$

Mecanismul de “atenție” (attention)

- Contextul patch-urilor – matricea de afinitate

					
		0.70		5.65	
		5.65		0.70	

$$\begin{matrix} \text{parrot} \end{matrix} = 0.7 * \begin{matrix} \text{parrot} \end{matrix} + 5.65 * \begin{matrix} \text{potted plant} \end{matrix}$$

Mecanismul de “atenție” (attention)

Contextul patch-urilor – matricea de afinitate

		0.70		8.48
		8.48		0.70

$$\text{Patch} = 0.7 * \text{Patch} + 8.48 * \text{Patch}$$

Mecanismul de “atenție” (attention)

□ Contextul patch-urilor – matricea de afinitate

$$\begin{bmatrix} \text{bird} \end{bmatrix} = 0.7 * \begin{bmatrix} \text{bird} \end{bmatrix} + 5.65 * \begin{bmatrix} \text{plant} \end{bmatrix}$$

$$\begin{bmatrix} \text{bird} \end{bmatrix} = 0.7 * \begin{bmatrix} \text{bird} \end{bmatrix} + 8.48 * \begin{bmatrix} \text{plant} \end{bmatrix}$$

$$\begin{bmatrix} \text{bird} \end{bmatrix} = ? * \begin{bmatrix} \text{bird} \end{bmatrix} + ? * \begin{bmatrix} \text{plant} \end{bmatrix}$$

$$\begin{bmatrix} \text{bird} \end{bmatrix} = ? * \begin{bmatrix} \text{bird} \end{bmatrix} + ? * \begin{bmatrix} \text{plant} \end{bmatrix}$$

Normalizare – de care?

Mecanismul de “atentie” (attention)

Contextul patch-urilor – matricea de afinitate

$$\begin{bmatrix} 0.7 \\ 0.7 \end{bmatrix} = 0.7 \begin{bmatrix} 0.7 \\ 0.7 \end{bmatrix} + 5.65 \begin{bmatrix} 0.7 \\ 0.7 \end{bmatrix}$$

$$\begin{bmatrix} 0.7 \\ 0.7 \end{bmatrix} = 0.7 \begin{bmatrix} 0.7 \\ 0.7 \end{bmatrix} + 8.48 \begin{bmatrix} 0.7 \\ 0.7 \end{bmatrix}$$

$$\begin{bmatrix} 0.0070 \\ 0.0070 \end{bmatrix} = 0.0070 \begin{bmatrix} 0.7 \\ 0.7 \end{bmatrix} + 0.9929 \begin{bmatrix} 0.7 \\ 0.7 \end{bmatrix}$$

$$\begin{bmatrix} 0.0004 \\ 0.0004 \end{bmatrix} = 0.0004 \begin{bmatrix} 0.7 \\ 0.7 \end{bmatrix} + 0.9958 \begin{bmatrix} 0.7 \\ 0.7 \end{bmatrix}$$

Normalizare – softmax

Mecanismul de “atenție” (attention)

Contextul patch-urilor – matricea de afinitate

$$\begin{bmatrix} \text{flowers} \\ \text{toucan} \end{bmatrix} = 0.7 \begin{bmatrix} \text{flowers} \\ \text{toucan} \end{bmatrix} + 5.65 \begin{bmatrix} \text{flowers} \\ \text{flowers} \end{bmatrix}$$

$$\begin{bmatrix} \text{flowers} \\ \text{flowers} \end{bmatrix} = 0.7 \begin{bmatrix} \text{flowers} \\ \text{flowers} \end{bmatrix} + 8.48 \begin{bmatrix} \text{flowers} \\ \text{flowers} \end{bmatrix}$$

$$\begin{bmatrix} \text{flowers} \\ \text{flowers} \end{bmatrix} = 0.0070 \begin{bmatrix} 2,2 \end{bmatrix} + 0.9929 \begin{bmatrix} 0,4 \end{bmatrix}$$

$$\begin{bmatrix} \text{flowers} \\ \text{flowers} \end{bmatrix} = 0.0004 \begin{bmatrix} 2,2 \end{bmatrix} + 0.9958 \begin{bmatrix} 3,3 \end{bmatrix}$$

Mecanismul de “atenție” (attention)

Contextul patch-urilor – matricea de afinitate

$$\begin{bmatrix} \text{flower} \\ \text{bird} \end{bmatrix} = 0.7 * \begin{bmatrix} \text{flower} \\ \text{bird} \end{bmatrix} + 5.65 * \begin{bmatrix} \text{flower} \\ \text{bird} \end{bmatrix}$$

$$\begin{bmatrix} \text{flower} \\ \text{bird} \end{bmatrix} = 0.7 * \begin{bmatrix} \text{flower} \\ \text{bird} \end{bmatrix} + 8.48 * \begin{bmatrix} \text{flower} \\ \text{bird} \end{bmatrix}$$

$$\begin{bmatrix} \text{flower} \\ \text{bird} \end{bmatrix} = [0.1400, 3.9850]$$

$$\begin{bmatrix} \text{flower} \\ \text{bird} \end{bmatrix} = [0.0008, 3.9840]$$

in spatiul proiectiei
definite de K si Q

Mecanismul de “atentie” (attention)

- Input – x - vectori de dimensiune $(N, \text{\#patches} \times \text{\#patches} + 1, D_e)$
- Output - vectori de dimensiune $(N, \text{\#patches} \times \text{\#patches} + 1, D)$

- $Q = x * W^q$

- $K = x * W^k$

- $V = x * W^v$

$$\text{softmax}\left(\frac{Q \times K^T}{\sqrt{d_k}}\right) V$$

=

Z

The diagram illustrates the attention mechanism. It shows the calculation of the attention matrix Z . The input x is multiplied by weight matrices W^q , W^k , and W^v to produce Q , K , and V respectively. Q and K are then multiplied and divided by the square root of the key dimension d_k , followed by a softmax operation, and finally multiplied by V to produce the output Z .

Mecanismul de “atentie” (attention)

Input									
representation	x_1 								
Queries	q_1 								
Keys	k_1 								
Values	v_1

Mecanismul de “atentie” (attention)

❑ Interogari intr-o BD

■ Input:

- ❑ O multime de recorduri $\{ (key_i, value_i), i = 1, 2, \dots, m \}$
- ❑ Un query q

■ Output

- ❑ $value_j$ a.i. q e similar cu key_j

■ Exemplu - text

- ❑ $\{ (Apostol, Mihai), (Baciu, Alina), (Cretu, Gabriel), (Pop, Ionica), (Popa, Madalina), (Popescu, Cosmina) \}$
- ❑ $Q = \text{“Pop”}$
- ❑ Answer:
 - Ionica – perfect match (e.g. Hamming Distance)
 - Ionica, Madalina, Cosmina – partial match (e.g. Levenshtein Distance), top-k raspunsuri

Q=Pop	Apostol	Baciu	Cretu	Pop	Popa	Popescu
Hamming	6	5	5	0	4	7
Levenshtein	6	5	5	0	1	4

Mecanismul de “atentie” (attention)

□ Interogari intr-o baza de date

■ Exemplu - text

□ DB = {(Apostol, Mihai), (Baciu, Alina), (Cretu, Gabriel), (Pop, Ionica), (Popa, Madalina), (Popescu, Cosmina)}

□ Q = “Pop”

□ Answer:

Q=Pop	Apostol	Baciu	Cretu	Pop	Popa	Popescu
Hamming	6	5	5	0	4	7
Levenshtein	6	5	5	0	1	4

▪ {Ionica} – perfect match (e.g. Hamming Distance)

▪ {Ionica, Madalina, Cosmina} – partial match (e.g. Levenshtein Distance), top-k raspunsuri

■ Mecanismul de atentie

□ $\text{Attention}(q, \text{DB}) = \sum \alpha(q, \text{key}_i) * \text{value}_i$,

□ $\alpha(q, \text{key}_i)$ – attention weights

▪ Daca un singur coefficient e 1 si restul 0 → interogari clasice in baze de date

▪ Daca toti coefficientii $\alpha = 1/m \rightarrow$ Average Pooling

▪ Pentru a avea coeficienti α ca ponderi (weights)

▪ $\alpha'(q, \text{key}_i) = \alpha(q, \text{key}_i) / \sum \alpha(q, \text{key}_j)$

▪ $\alpha''(q, \text{key}_i) = \exp(\alpha(q, \text{key}_i)) / \sum \exp(\alpha(q, \text{key}_j))$

Mecanismul de “atentie” (attention)

Weights

Weights = [0.90, 0.70, 0.80, 0.50, 0.20, 0.60, 0.15, 0.10, 0.20]
Weights_softmax = [0.16, 0.13, 0.14, 0.11, 0.08, 0.12, 0.078, 0.074, 0.08]

Suma valorilor
re-ponderate

M
I
R
P
R

■ V1: Integrarea atentiei intr-o CNN – de ex ResNet¹

- Cum?
 - Straturi suplimentare
- Pro
 - Integrare facila
- Contra
 - Modelul (arhitectura) e dominate de convolutii

Cum se poate integra mecanismul de atentie intr-o retea neuronală pentru procesarea imaginilor?

■ V2: Inlocuirea convolutiei cu o "atentie locala" ("local relation")

■ Cum?

- Convolutia = produs scalar intre filtru si patch
- Local attention
 - Centrul patch-ului -> query (vector cu D elemente)
 - Fiecare element din patch ->
 - Keys (vector $R \times R \times D$)
 - Values (vector $R \times R \times C'$)
 - Outputul e calculate cu ajutorul mecanismului de atentie

■ Pro

- Numar mai mic de parametrii (in Hu et al.: ResNet-50 are 25.5×10^6 param, iar LR-Net-50 are 23.3×10^6 params)

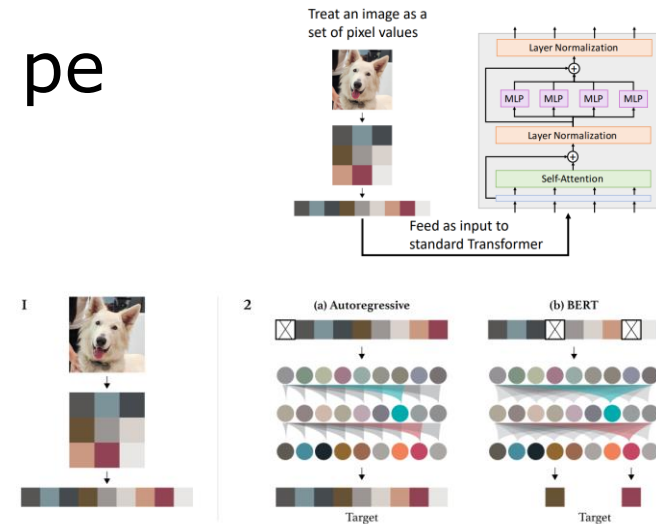

■ Contra

- Implementare dificila (multe detalii tricky)
- Doar putin mai buna ca ResNet

Cum se poate integra mecanismul de atentie intr-o retea neuronală pentru procesarea imaginilor?

- ❑ V3: transformer aplicat direct pe pixeli
 - Cum?
 - ❑ Input-ul pt transformer este imaginea (redimensionata) si aplatizata
- ❑ Pro
 - Simplu (conceptual)
- ❑ Contra
 - O imagine de dimensiune $n \times n$ necesita n^4 elemente in fiecare matrice de atentie -> multa memorie

Cum se poate integra mecanismul de atentie intr-o retea neuronală pentru procesarea imaginilor?

□ V4: transformer aplicat pe patch-uri

■ Cum?

■ Pro

- Mai putine convolutii

■ Contra

- Numar mare de parametrii
- Nevoie de multe date de antrenament

Positional embedding

- Patche-uri → Embeddings
- Pentru o imagine cu $k \times k$ patch-uri, se obțin $k \times k$ embedding-uri (de lungime D_e)
 - Care țin cont de semantica patch-urilor
 - Linear Embeddings
 - descoperite / învățate
 - Cum? - prin ML (stratul linear al rețelei neuronale)
 - Care țin cont de poziția (absolută sau relativă) a patch-urilor în imagine
 - Positional Embeddings
 - calculate
 - cum? – prin formule :D

Positional embedding

□ Exemplu

- O imagine cu $k \times k$ patch-uri
- Fiecărui patch i se asociază
 - Un embedding semantic SE de lungime d
 - Un embedding pozițional PE de lungime d
 - Embedding-ul final corespunzător patch-ului va fi suma celor 2 (WE + PE) $\rightarrow (k \times k) \times d$ valori

Positional embedding - text

□ Ce valori conține PE?

■ Principii

- Embedding-urile trebuie sa păstreze distanța originală între cuvinte
 - $\text{dist}(\text{Emb}(\text{câine}), \text{Emb}(\text{pisică})) < \text{dist}(\text{Emb}(\text{câine}), \text{Emb}(\text{fereastră}))$
 - $\text{Dist}(\text{Emb}(\text{word}_k), \text{Emb}(\text{word}_{k+1})) = \text{Dist}(\text{Emb}(\text{word}_p), \text{Emb}(\text{word}_{p+1}))$
- Ortogonalitate - Embedding-urile cuvintelor ne-conectate să fie perpendiculare
 - $\text{Emb}(\text{ușă}) \perp \text{Emb}(\text{pește})$
 - $\text{Similaritate}(\text{ușă}, \text{pește}) = 0$
- Embedding-uri independente de lungimea propoziției
 - → putere de generalizare (train vs. test)
 - → *bounded*

■ Reprezentări / valori posibile

- Poziția efectivă (1,2,3,4)
- Poziția în reprezentare 1-hot encoding
- Poziția în reprezentare binară
- Poziția în reprezentare polară

Positional embedding – images

Position inside an image

□ Exemplu

- O imagine cu 4 patch-uri și $d = 1$
- $PE(patch) = \text{poziția patch-ului}$

0
1
2
3

Dist	p0	p1	p2	p3
p0	0	1	2	3
p1	1	0	1	2
p2	2	1	0	1
p3	3	2	1	0

$\text{sim}(PE(p_i), PE(p_j)) \neq 0$, orice $i, j, i \neq j$

Positional embedding – images

Normalised position inside an image

□ Exemplu

- O imagine cu 4 patch-uri și $d = 1$
- $PE(patch) = \text{poziția patch-ului}$

0
1
2
3

- Problema: al k-lea patch într-o imagine cu n patch-uri are alt embedding decât al k-lea patch într-o propoziție cu m patch-uri

Positional embedding – images

1-hot encoding

0	0	0	0	0	1
0	0	0	0	1	0
0	0	0	1	0	0
0	0	1	0	0	0

□ Exemplu

- O imagine cu 4 patch-uri și $d = 6$
- $PE(patch) =$ reprezentarea 1-hot a poziției patch-ului

Dist	p0	p1	p2	p3
p0	0	1.4	1.4	1.4
p1	1.4	0	1.4	1.4
p2	1.4	1.4	0	1.4
p3	1.4	1.4	1.4	0

$dist(PE(p0), PE(p1)) = dist([0,0,0,0,0,1], [0,0,0,1,0,0]) = \sqrt{1^2 + 1^2} = 1.41$
 $sim(PE(w_i), PE(w_j)) = 0$, orice $i, j, i \neq j$

Positional embedding – images

Binary encoding

0	0	0	0	0	0
0	0	0	0	0	1
0	0	0	0	1	0
0	0	0	0	1	1

□ Exemplu

- O imagine cu 4 patch-uri și $d = 6$
- $PE(patch) =$ reprezentarea binară a poziției patch-ului

Dist	p0	p1	p2	p3
p0	0	1	1	$\sqrt{2}$
p1	1	0	$\sqrt{2}$	1
p2	1	$\sqrt{2}$	0	1
p3	$\sqrt{2}$	1	1	0

exista i, j a.î. $\text{sim}(PE(p_i), PE(p_j))=0$

Positional embedding – images

Sin-based encoding

□ Exemplu

- O imagine cu 4 patch-uri și $d = 6$
- $PE(patch) =$ valorile funcției sin pentru diferite argumente (frecvențe sau lungimi de undă)
 - E.g. $\sin(2 \pi \text{ pos} / \lambda_i)$, $i = 0, 1, 2, \dots, d-1$

pos		$\lambda = \pi$	$\lambda = 2\pi$	$\lambda = 3\pi$	$\lambda = 4\pi$	$\lambda = 5\pi$	$\lambda = 6\pi$
0	→	$\sin(2*0)$	$\sin(0)$	$\sin(2/3*0)$	$\sin(2/4*0)$	$\sin(2/5*0)$	$\sin(2/6*0)$
1	→	$\sin(2*1)$	$\sin(1)$	$\sin(2/3*1)$	$\sin(2/4*1)$	$\sin(2/5*1)$	$\sin(2/6*1)$
2	→	$\sin(2*2)$	$\sin(2)$	$\sin(2/3*2)$	$\sin(2/4*2)$	$\sin(2/5*2)$	$\sin(2/6*2)$
3	→	$\sin(2*3)$	$\sin(3)$	$\sin(2/3*3)$	$\sin(2/4*3)$	$\sin(2/5*3)$	$\sin(2/6*3)$
4	→	$\sin(2*4)$	$\sin(4)$	$\sin(2/3*4)$	$\sin(2/4*4)$	$\sin(2/5*4)$	$\sin(2/6*4)$

Positional embedding – images

Sin-based encoding

Exemplu

- O imagine cu 4 patch-uri și $d = 6$
- $PE(patch) =$ valorile funcției sin pentru diferite argumente (frecvențe sau lungimi de undă)

□ E.g. $\sin(2\pi \cdot pos / \lambda)$, $i = 0, 1, 2, \dots, d-1$

pos	$\lambda = \pi$	$\lambda = 2\pi$	$\lambda = 3\pi$	$\lambda = 4\pi$	$\lambda = 5\pi$	$\lambda = 6\pi$
0 →	$\sin(0)$	$\sin(0)$	$\sin(0)$	$\sin(0)$	$\sin(0)$	$\sin(0)$
1 →	$\sin(2 \cdot 1)$	$\sin(1)$	$\sin(2/3 \cdot 1)$	$\sin(2/4 \cdot 1)$	$\sin(2/5 \cdot 1)$	$\sin(2/6 \cdot 1)$

$\sin(PE(p_0), PE(p_k)) = 0!!!$

Positional embedding – in Sin&cos-based encoding

□ Exemplu

■ O imagine cu 4 patch-uri și $d = 6$

■ $PE(patch) =$ valorile funcției sin pentru diferite argumente (frecvențe sau lungimi de undă)

□ E.g. $(\sin(pos / 10000^{2i/d}), \cos(pos / 10000^{2i/d})), i = 0, 1, 2, \dots, d-1$

pos		i=0	i=1	i=2	i=3	i=4	i=5
0	→	$\sin(0)$	$\cos(0)$	$\sin(0)$	$\cos(0)$	$\sin(0)$	$\cos(0)$
1	→	$\sin(1)$	$\cos(1)$	$\sin(1/10000^{4/6})$	$\cos(1/10000^{4/6})$	$\sin(1/10000^{8/6})$	$\cos(1/10000^{8/6})$
2	→	$\sin(2)$	$\cos(2)$	$\sin(2/10000^{4/6})$	$\cos(2/10000^{4/6})$	$\sin(2/10000^{8/6})$	$\cos(2/10000^{8/6})$
3	→	$\sin(3)$	$\cos(3)$	$\sin(3/10000^{4/6})$	$\cos(3/10000^{4/6})$	$\sin(3/10000^{8/6})$	$\cos(3/10000^{8/6})$
4	→	$\sin(4)$	$\cos(4)$	$\sin(4/10000^{4/6})$	$\cos(4/10000^{4/6})$	$\sin(4/10000^{8/6})$	$\cos(4/10000^{8/6})$

Positional embedding – images

Sin&cos-based encoding

Cum se poate imbunatati performanta unui ViT?

ViT vs CNN

In most CNNs (including ResNets), **decrease** resolution and **increase** channels as you go deeper in the network (Hierarchical architecture)

Useful since objects in images can occur at various scales

In a ViT, all blocks have same resolution and number of channels (Isotropic architecture)

Cum se poate imbunatati performanta unui ViT?

Input:

- A matrix of $n \times m$ values (e.g. a grayscale image of $n \times m$ pixels)

Layers:

- 1 convolution with F filters of $k \times k$ (stride 1)
 - Output: a matrix of $(n - 1) \times (m - 2) \times F$ values
 - #operations: $[(n - 2) * (m - 2) * (k * k)] * F$
 - #parameters: $(k * k + 1) * F$
- 1 pooling of $p \times p$
 - Output: a matrix of $(n / p) \times (m / p)$ values
 - #operations: $(n / p) * (m / p) * (p * p - 1)$
 - #parameters: 0
- 1 fully connected layer
 - #input neurons = $n * m$
 - #output neurons = c
 - #operations: $(n * m) * c$
 - #parameters: $(n * m) * c + c$
- Transformer
 - Patching ($p \times p$ patches $\Rightarrow L = n * m / (p * p)$ patches)) and Linear transformation into a space of dimension d
 - Output: a matrix $L \times d$
 - #operations: $L * [(p * p) * d]$
 - #parameters: $[L * (p * p)] * d$
 - Attention for an input of $L \times d$ values
 - Output: a matrix of $L \times d_{\text{model}}$ values
 - #operations:
 - Projections (Q, K, V): $3 * L * d * d_{\text{model}}$
 - QK : $L * L * d_{\text{model}}$
 - Softmax: $L * L$
 - Weights: $L * L * d_{\text{model}}$
 - #parameters: $3 * (d * d_{\text{model}} * d_{\text{model}})$
 - FeedForward layer:
 - Input: a matrix of $L \times d_{\text{model}}$ values
 - Output: a matrix of $L \times d_{\text{out}}$ values
 - #operations: $(L * L) * (d_{\text{model}} * d_{\text{out}} + d_{\text{out}})$
 - #parameters: $d_{\text{model}} * d_{\text{out}} + d_{\text{out}}$

Cum se poate imbunatati performanta unui ViT?

□ Regularizare

- Weight decay, stochastic depth, dropout

□ Data augmentation

- MixUp, RandAugment

Cum se poate imbunatati performanta unui ViT?

□ Distillation

CNN

Step 1: Train a **teacher model** on images and ground-truth labels

$P(\text{cat}) = 0.9$
 $P(\text{dog}) = 0.1$

Cross
Entropy
Loss

GT label:
Cat

Step 2: Train a **student model** to match predictions from the **teacher** (sometimes also to match GT labels)

$P(\text{cat}) = 0.1$
 $P(\text{dog}) = 0.9$

KL Divergence Loss

$P(\text{cat}) = 0.2$
 $P(\text{dog}) = 0.8$

Cross
Entropy
Loss

GT label:
Dog
